

LZ0P3821

1/7-type Built-in Lens Color CMOS Image Sensor with 110 k Pixels

DESCRIPTION

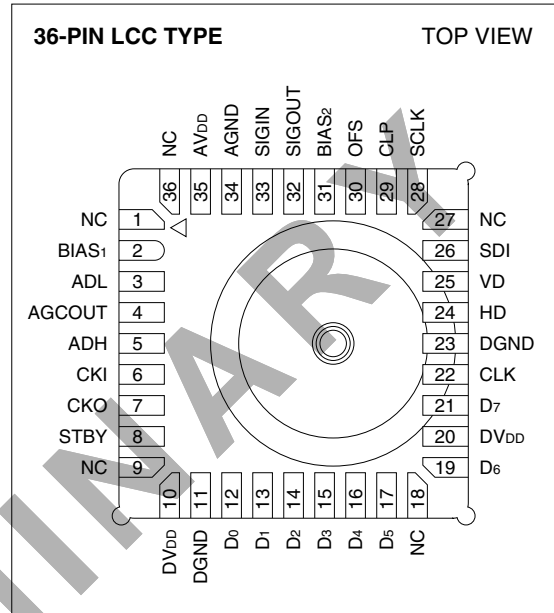

The LZ0P3821 is a 1/7-type (2.55 mm) 110 000-pixel built-in lens color CMOS (Complementary Metal Oxide Semiconductor) image sensor that consists of a timing generator (TG), a correlated double sampling (CDS) circuit, an auto gain control (AGC) circuit and an analog-to-digital converter (ADC) circuit. With small lens and LCC-type flat package, possible to make ultra small color camera easily.

FEATURES

- Progressive scan
- Square pixel
- Compatible with CIF standard
- Number of image pixels : 367 (H) x 291 (V)
- Number of optical black pixels
 - Horizontal : 13 front and 13 rear
 - Vertical : 4 front and 4 rear
- Pixel pitch : 5.6 μm (H) x 5.6 μm (V)
- R, G, and B primary color mosaic filters
- Image inversion function (horizontally and/or vertically)
- Available for two types of power save mode
 - AGC and AD circuits become power-off with serial data.
 - All circuits become power-off with STBY pin.
- Analog output and 8-bit digital output
- Variable gain control (3 to 30 dB)
- Variable electronic focal plane shutter (1/30 to 1/10 000 s)
- Single +2.8 V power supply
- Built-in IR cut-off filter
- Integrated lens : 58° horizontal viewing angle
- Package
 - 36-pin LCC* type
 - Outline dimensions : 11.4 mm (H) x 11.4 mm (V)
 - Height : Approx. 5 mm

* Leadless Chip Carrier

NOTES :

- The average output voltage of G signal in the central area (H/10, V/10) under uniform illumination.
The standard exposure conditions are defined as when Vo is 150 mV.
- The average output voltage of G signal in the central area (H/10, V/10) under 10 times exposure of the standard exposure conditions.
- The difference between average output voltage of the image area and that of the OB area, under non-exposure conditions.
- The image area is divided into 10 x 10 segments under non-exposure conditions. DSNU is defined by (Vdmax-Vdmin), where Vdmax and Vdmin are the maximum and minimum values of each segment's voltage respectively.
- The average output voltage of G signal in the central area (H/10, V/10) when a 1 000 lux light source with a 90% reflector is imaged.
- One mean horizontal line signal <bi> is obtained by adding all the horizontal line signals <aij> vertically and dividing them by the line number. <xi> is the deviation of the center pixel from the average of successive 5 pixels in <bi>. VFPN is the maximum absolute value of <xi>.
- The resolution in the central area (H/10, V/10) at which the image of the TV resolution chart (ex. EIAJ test chart) can be distinguished on the B/W video monitor when converted into composite video signal.
- The resolution in the peripheral area (image height : Y = 0.7) under the conditions mentioned above.
- Defined by the following formula at the brightness of standard output voltage of G signal : (Vco/Vce) x 100 [%]
Vco : Output voltage at edge (image height : Y = 0.8) of the image.
Vce : Output voltage at center of the image.
- The difference between the center position of image and that of the monitor. This is the ratio for the horizontal underscanning monitor size which includes the decentering eccentricity when turning the lens head one time.
- Total current of power supply in standby mode. (Pin No.8 (STBY) is fixed to "H" level and other input pins are fixed to "H" level or "L" level.)
- Total current of analog and digital power supplies, in the dark and at the standard load conditions. (Pin No.6 [oscillator] is external input. Pin No.7 is open.)

LENS SPECIFICATIONS

PARAMETER	SPECIFICATION	NOTE
Construction	Single (non-spherical, plastic)	
Focal length	2.0 mm±5% [reference]	
F No.	2.8±5%	
Viewing angle	H : 58°, V : 46°, Diagonal : 73° [TYP. : reference]	1
TV distortion	-4.2% [TYP.]	2
Focus adjustment range	∞ to 10 cm	3
Torque of focusing	0.0005 to 0.01 N · m	4

NOTES :

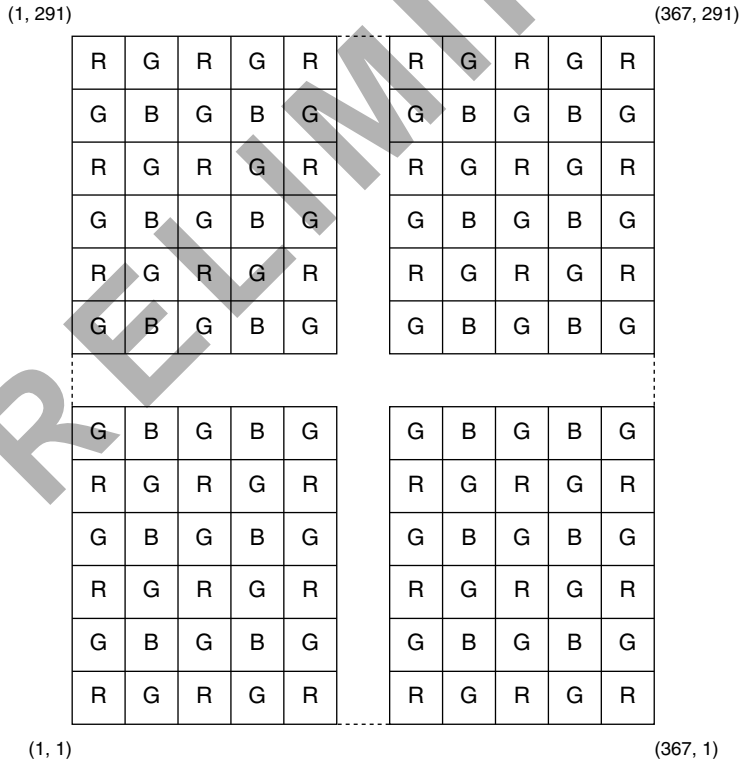

- Image area : 2.06 mm (H) x 1.63 mm (V)
 - TV distortion is defined by the formula, $(\Delta y/y) \times 100$ [%] at capturing rectangular pattern sized horizontal by vertical as 4 by 3.
"y" is defined as the vertical height of center of the horizontal line.
"Δy" is defined as the difference between the vertical height of the center of the horizontal line and edge of it.
 - The best focus point of an object can be obtained by turning the lens head within this range.
 - Torques which are necessary for turning the lens on 0.5 to 1.5 rounds.
- * Be careful not to remove the lens head by turning it counterclockwise too much when adjusting macro.

TIMING CHART

HORIZONTAL PULSE TIMING

- The rising edge of the HD pulse must be between two rising edges of CLK (0) and CLK (1).
- The falling edge of the HD pulse must be between two rising edges of CLK (90) and CLK (91).

PHASE RELATIONS BETWEEN DIGITAL OUTPUT (ADOUT) AND CLOCK (CLK)

VERTICAL PULSE TIMING

- The rising edge and falling edge of the VD pulse must be in high period of the HD pulses.

SERIAL DATA TIMING (SDI, SCLK)

- Data in SDI are taken at the rising edge of SCLK.
- Clock frequency of SCLK should be less than 1/2 of that of CLK.
- Do not insert the SDI and SCLK pulses between 36H* and 37H*. Refer to "VERTICAL PULSE TIMING".
- Refer to "SERIAL DATA INPUTS" for the contents of serial data from D0 to D38.

* It means ordinal number of the HD pulse.

PRECAUTIONS FOR BUILT-IN LENS CMOS IMAGE SENSORS

1. Package Breakage

In order to prevent the package, the lens holder, and the lens from being broken, follow the instructions below :

- 1) The built-in lens CMOS image sensor is a precise optical component and the package-base material is ceramic.

Therefore,

- Take care not to drop the device when mounting, handling, or transporting.
- Avoid giving a shock to the package.
Especially when pins are fixed to the socket or the circuit board, a small shock could break the package more easily than when the package isn't fixed.

- 2) If any damage or breakage occurs on the surface of the lens, its characteristics could deteriorate.

Therefore,

- Do not hit the lens.
- Do not give a shock large enough to cause distortion.
- Do not scrub or scratch the surface of the lens.
 - Even a soft cloth or applicator, if dry, could cause flaws to scratch the lens.

2. Electrostatic Damage

As compared with general MOS-LSI, CMOS image sensor has lower ESD. Therefore, take the following antistatic measures when handling the CMOS image sensor :

- 1) Always discharge static electricity by grounding the human body and the instrument to be used.
To ground the human body, provide resistance of about 1 M Ω between the human body and the ground to be on the safe side.
- 2) When directly handling the device with the fingers, hold the lens holder and do not touch the pin.

- 3) To avoid generating static electricity,
 - a. do not scrub the lens and package with cloth etc.
 - b. do not attach any tape or labels.
- 4) When storing or transporting the device, put it in a container of conductive material.

3. Dust and Contamination

Dust or contamination on the surface of the lens and the inside of the lens holder could deteriorate the output characteristics or cause a scar. In order to minimize dust or contamination on the device, take the following precautions :

- 1) Do not remove the lens from the body.
Especially when adjusting macro, be careful not to remove the lens by turning it counter-clockwise too much.
- 2) Do not touch the surface of the lens with the fingers. If dust or contamination gets on the surface of the lens, the following cleaning method is recommended :
 - Handle the built-in lens CMOS image sensor in a clean environment such as a cleaned booth. (The cleanliness level should be, if possible, class 1 000 at least.)
 - Dust from static electricity should be blown off with an ionized air blower. For anti-electrostatic measures, however, ground all the pins on the device before blowing off the dust.
 - The contamination on the surface of the lens should be wiped off with a clean applicator soaked in isopropyl alcohol. Wipe slowly and gently in one direction only.
 - Frequently replace the applicator and do not use the same applicator to clean more than one device.
 - Make sure there is no dust or contamination on the lens and screw it on the lens holder.

4. Other

- 1) Soldering should be manually performed within 1.5 seconds per pin at 400°C maximum at the tip of soldering iron.
 - Use ESD-measured soldering iron
 - The conditions of the soldering time in which the soldering iron touches the package.
 - In case where the soldering may exceed 1.5 seconds per pin, resume the work after the device returns to normal temperature.
 - Do not put too much force onto the lens and the lens holder while soldering.
 - Be careful not to let the soldering iron touch the lens holder.
 - Soldering can be quickly/neatly done by laying the soldering iron so it lightly touches the border between the package and the circuit board and sliding it in sideways.
- 2) There is no guarantee of the performance of the device which has been removed or resoldered after being soldered once under the conditions mentioned above.
- 3) Avoid using or storing the built-in lens CMOS image sensor at high temperature or high humidity as it is a precise optical component. Do not give a mechanical shock to the built-in lens CMOS image sensor.
- 4) Do not expose the device to strong light. For the color device, long exposure to strong light will fade the color of the color filters.
